

VEGA get interactive on water

To further support customers involved in the water sector, VEGA have launched an application based, interactive website about their innovative solutions for the water industry. Aimed at both experienced and inexperienced water instrumentation users alike, it covers aspects of sewage system monitoring, main treatment plant processes and open water gauging. It features their latest innovation: VEGAPULS WL61 non contact water radar level transmitter. The applications shown across the site are a perfect demonstration of the versatility of the radar level technology, along with other innovative techniques for process control solutions. Process animations feature alongside their written descriptions, application challenges, user benefits and click-through access to detailed product information, application data sheets and all related manuals and certificates. There is a printed brochure available to also support the new website for users who may prefer a paper version. Contact VEGA if you would like a brochure, or if you have an application you would like to discuss.
